1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

3. Claims 1-6 are rejected under 35 U.S.C. 103(a) as being unpatentable over Donado et al. in view of Deevi et al.

Donado et al. discloses the invention substantially as claimed. Donado et al. discloses at col. 4, line 19 to col. 6, line 2, a method of making an Ni-Al alloy anode comprising:

providing a Ni-Al alloy powder;

compacting said Ni-Al alloy powder; and

sintering the compacted Ni-Al alloy powder to form a Ni-Al alloy anode.

Art Unit: 1742

However, Donado et al. do not disclose Ni powder in addition to the Ni-Al alloy powder, but discloses prealloyed Ni-Al powder singularly.

Deevi et al. teaches at [019] to add Ni powder to Ni-Al alloy powder in the analogous field of forming sintered alloy compacts for the purpose of improving the compact density.

It would have been obvious to one of ordinary skill in the art at the time of the invention to add Ni powder as taught by Deevi et al. to the invention of Donado et al. in order to improve the sinter density of the formed anode.

Deevi et al. is silent as to the amount of the Ni powder addition, leaving it to one of ordinary skill to determine through routine experimentation the amount of the addition, selecting minimum amounts of Ni so as to allow for formation of Ni-Al alloy during sintering.
